

27042751 - v2.5.1 Calendar / Capacity Regression Hotfix

Business request summary

A newly introduced calendar and capacity planning change broke previously working enterprise calendar behavior. The hotfix must restore the affected flows without removing the useful multi-position and multi-skill coverage improvements.

Requested fixes

- Make office coverage rule saving schema-cache safe. Preserve the new array-column save path, but fall back to legacy columns when PostgREST cannot see `business_roles` or `skill_ids`.
- Remove the Capacity Planner rule-edit shortcut because it navigates to the wrong place.
- Replace long no-rule text in the monthly Capacity Planner grid with subtle grey day cells and thin separators.
- Move Timeline filters into a narrow left sidebar on desktop while keeping mobile layout stacked.

Regression constraints

- Do not duplicate existing calendar tabs or rule editors.
- Do not remove existing calendar, annual view, timeline, capacity planner, or skill capacity report features.
- Do not depend on production migrations having already refreshed the Supabase schema cache.
- Keep fallback behavior targeted only to relevant missing-column schema errors.
